

Sulu Product Bundle

github.com/sulu/SuluProductBundle

From the Sulu skeleton to a product overview,
and beyond

Daniel Mathis · Full Stack Developer · github.com/Prokyonn

Repository

The idea

A product is Sulu content.

- Like a page or an article
 - SEO/Excerpt, URL, preview
 - Draft, publish, versions, workflow
- Plus product logic
 - Families, attributes, variants, associations
- Not a shop system
 - A flexible presentation layer for your products
- Three types: product, product with variants, variant

The idea

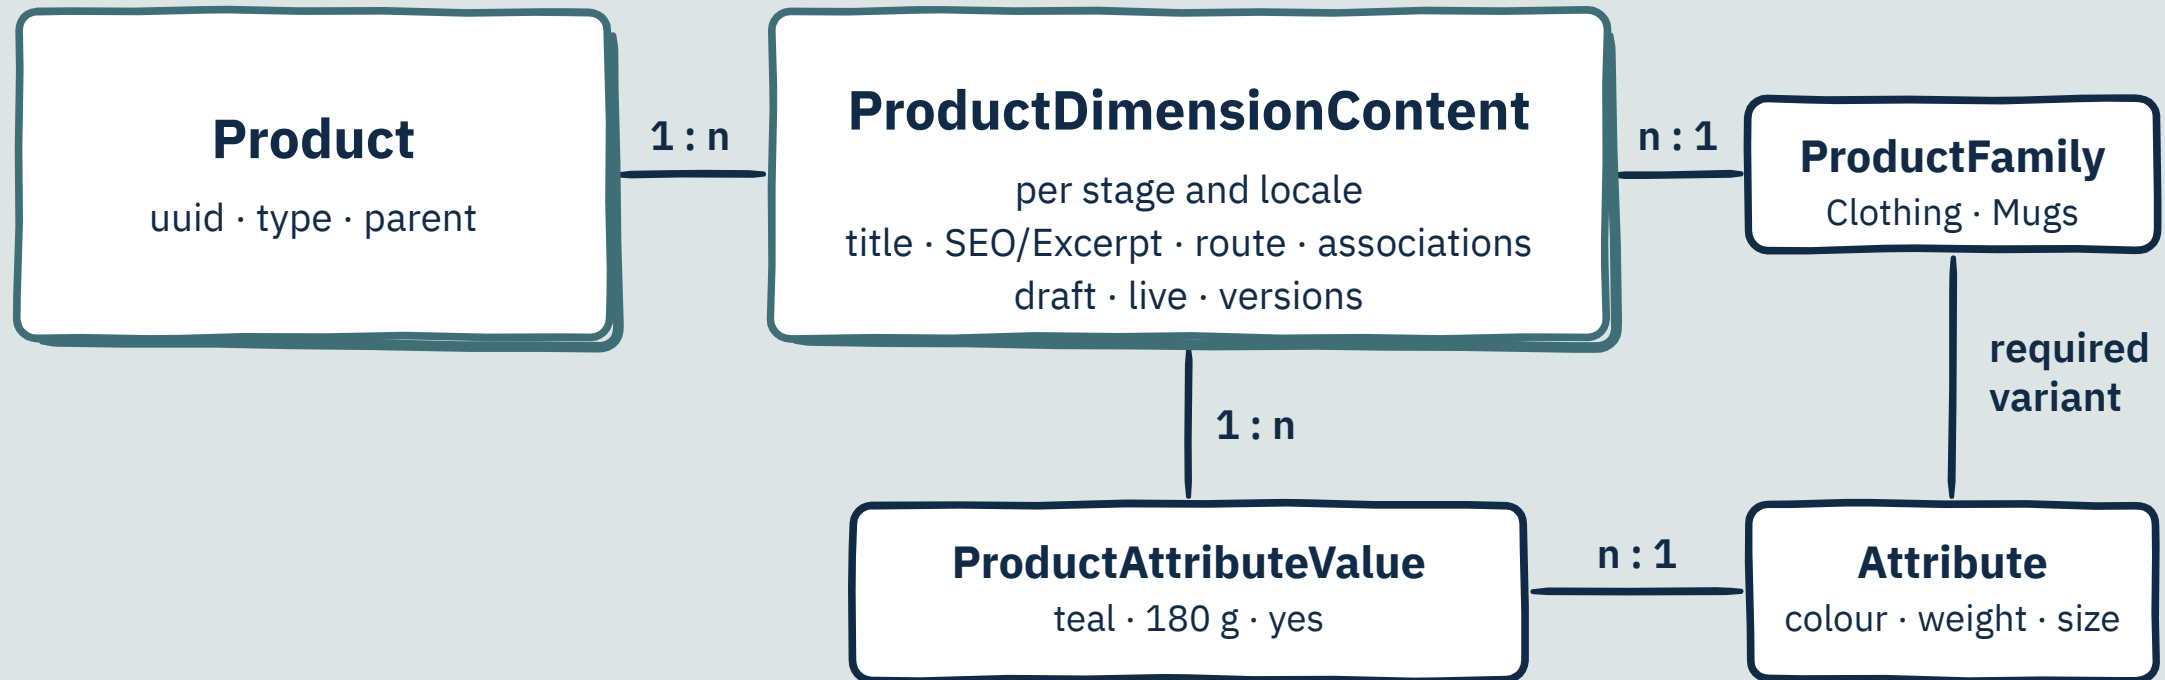

One product, many variants.

- Product: the shared facts, like title, family, material
- Variant: own colour, size, picture and URL
- One URL per product: coming soon

Under the hood

The entity model.

Describing products

Groups, attributes, families.

Attribute group

- Look, Material & care, Specs, Good to know
- One block in the admin form and on the website

Attribute

- One fact with a type
- Colour, weight, release date
- Filterable on request

Product family

- Clothing
- Per attribute: required or variant
- Set per family

The family decides the form. Required can differ per family. On the page the variant's value wins.

Describing products

Five types of attributes.

Text

Hello, World!

Print motif, fun fact. Translatable.

Number

180 g 40 °C 330 ml

Units from 17 measurement families.

Date

2 March 2026

Release date, in your format.

Options

Organic cotton

One value from a fixed list.

Boolean

Yes

Dishwasher safe, limited edition.

Coming soon

Range, multiple selection and more.

Filterable attributes become filters in the search.

The plan

Today, in a fresh skeleton.

Install and import

The bundle, the catalogue as data, a console import.

Product page

Tailwind frontend, attributes, related products.

Variants

Colour and size, each with its own URL.

Search

A catalogue page with filters and SEAL search.

AI

An AI client manages products through MCP. Symfony AI tools come with the bundle.

Review

Products need a review before they go live.

Nine steps. One branch per step. Every step starts from the one before.

Live Coding

One pull request per step, from the empty skeleton to the finished shop.
